

Quo vadis?

Jeffrey Hughes
Boston University

Quo vadis?

Where are you going?

Quo vadis?

Where are you going?
(Where art thou going?)

Quo venimus?

From where are we coming?

GEM – Geospace Environment Modeling

- 1987 First planning meeting in Seattle
- 1990 program gets initial funding.
- Goal: To understand how the magnetosphere worked as a global system – how do all the pieces work together.
- Plan: A series of campaigns focusing on problems that needed solving in order to model the magnetosphere globally.

CISM – Center for Integrated Space Weather Modeling

- 1997 First discussions about how to fund and build a global model.
- 2000 Initial Funding
- 2002 Full Funding
- Goal: The Sun-Earth system must be treated as a system.
- Plan: Create Sun-to-Earth models from existing component models – for both scientific understanding and prediction.

Space Weather

Space Weather

- Space weather impacts are well known
 - Navigation (GPS)
 - Power Grids (geomagnetically induced currents)
 - Communications (ionospheric scintillation)
 - Spacecraft (energetic particles)
 - Human's in space (radiation)
- Applied Science – Science in the service of society

StarFire Global SBAS is a key enabler

- Deere needed a way to accurately position agricultural equipment in rural areas on a global basis
 - Accurate enough to automatically steer a tractor or a combine
- Solution needed to be simple and not require local infrastructure

Whether your surveying
a 500 mile pipeline or
1000 miles at sea,
you still get 10 cm accuracy

From: Ron Hatch, Space Weather Workshop, April 2010

Deere developed its own commercial system that includes:

- Worldwide network of reference stations
- Processing centers computes orbit & clock corrections
- StarFire channels on GEOs streams corrections to users

Applications

Precision Farming

Yield Monitoring

Automatic Guidance

Water Management

Implement Positioning

Coordinated &

Robotic Machines

Other

Marine Survey

Land Survey

Military

Space Weather – the science

- Understand the impacts of (primarily) the Sun on the geospace system:
 - Photonic radiation (flares – X rays, EUV)
 - Particle radiation (solar energetic particles – also GCR's)
 - Plasmas and Fields (CME's and CIR's)
- Need to predict the occurrence and the effects of these events

SWPC plans for model transitions to operations

The proposed way forward to develop improved space weather models to maximize solar wind and CME data for extended forecast and warnings

- Solar Wind Disturbance Propagation Model (WSA-Enlil-Cone Model)
 - Geomagnetic storm predictions go from ~1 hour to 18hr - 4 days
- Geospace Response Model
 - Will replace limited value global predictions with actionable regional forecasts and warnings
- Energetic Particle Transport Model
 - Model to predict radiation storm peak intensity, timing, and spectrum; no models currently exist!

O&M includes Operation to Research (O2R) feedback to continuing R&D

The image is a composite of several solar observations. On the left, a large, bright, and detailed view of the Sun's surface shows turbulent convection and bright, active regions. To the right and slightly above, there are several smaller, semi-circular or arc-shaped images showing the solar corona, characterized by glowing, filamentary structures and bright points of light (flares or coronal mass ejections). The background is a deep black, representing the vacuum of space.

Solar and Heliospheric Physics

Solar Flares

- Old flare model
[Pneuman and Kopp]

- CME model [Gosling]

- CME model [Forbes]

Solar Wind Predictions – current sheet location and V_{sw} at 1 AU

Solar Wind Velocity observed at Earth and Stereo A and B

Where does the solar wind end ? – the interaction of the solar wind and the interstellar medium.

*Plasma
temperature and
flow lines*

In December 2004
Voyager 1 passed through
the termination shock at a
distance of 94 AU.

Plasma density

Voyager 2 followed in
August 2007 at a
distance of 84 AU.

Interstellar Boundary Explorer (IBEX) Energetic Neutral Atom Images of the interaction between the Local Interstellar Medium and the Heliosphere

McComas et al., Science, 2009

The Explanation

Parker's (1961) sketches of the LISM/Heliosphere interaction for dominant (A) dynamic pressure and (B) magnetic pressure

Visualization of the heliopause showing B_{LISM} and direction of motion

McComas et al., Science, 2009

Local ISM/Heliosphere interaction with a strong B_{LISM}

Opher et al., ApJ, 2006

Comparison of IBEX image with B.r angle from model

Maximum ENA flux comes from regions where $\mathbf{B}$ is orthogonal to line-of-sight.

The local galactic magnetic field

Current best estimate:

$B_{\text{LISM}} \sim 0.5 \text{ nT}$, at 30° to both the galactic plane and the ISM flow direction.

This is several times larger than expected and at an unexpected angle.

Is the field tilted or turbulent?

Astrophysics

A detailed astronomical image of the Orion Nebula, showing vibrant red and blue gas clouds, dark dust lanes, and numerous bright stars. The nebula's structure is complex, with various filaments and knots of gas and dust. The stars are scattered throughout the field, some appearing as sharp points of light and others as more diffuse, glowing sources.
